

Almost 90 per cent of functionality in future innovations will be characterized by the use of electronics.

Cosyst Control Systems GmbH specializes in the development of individual embedded control systems and also supports its customers in the development of electronic systems for many fields of application.

We create concepts and find solutions which are focused on the project goals of our customers. Our services cover all development phases from product requirement specification, function design, to rapid prototyping and final implementation in hard and software.

Cosyst Control Systems GmbH development areas includes analogous and digital circuit design, programmable logic, hardware oriented programming and the development of state or control-based real time applications.

Generic and modular concepts assure the flexibility and reusability with the highest reliability. Open system architectures allow sub functions to be realized by the customer.

Cosyst Control Systems GmbH works using a proven, clearly structured development process based on the V-model. Project-specific tailoring makes need-oriented and cost-optimized development possible, thus the quality degree of the development is substantially increased and development time and costs are reduced.

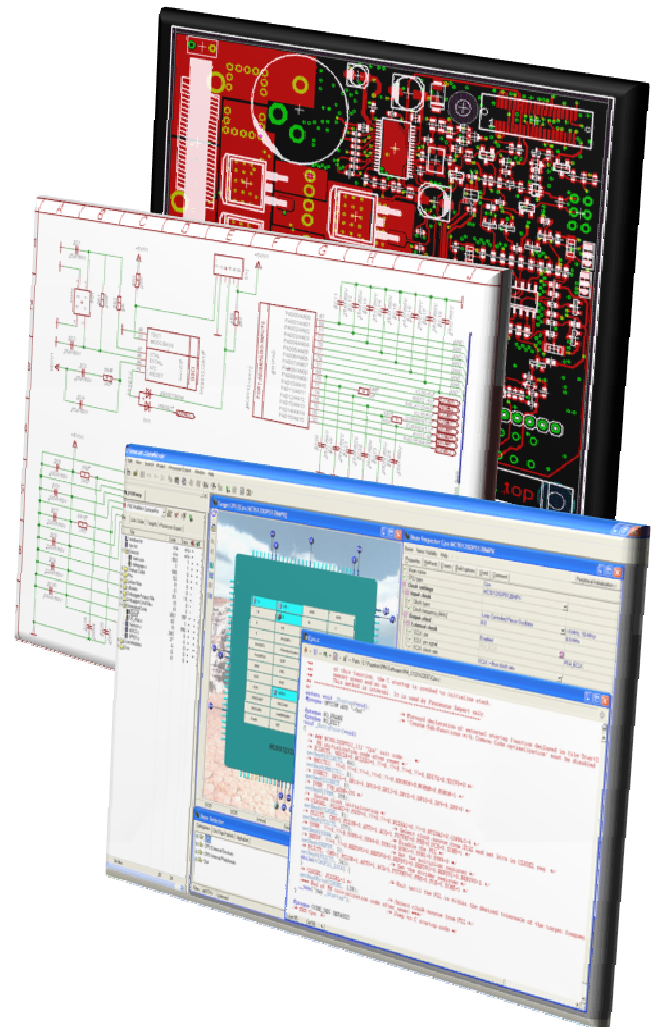

The high quality demands, which we build into our products, are checked with common standards and individual requirements.

There is a mixture of tasks from the developmental stage up until series production which need to be done in parallel during development, for this we are able to share our experience and know-how.

Additionally our customers benefit from our contacts in the area of test, validation and construction. In the development of safety relevant systems we also cooperate with established partners, manufacturing of the developed products is undertaken by our partners also.

We also have very close relations to national and international universities and research institutes.

Our development team consists of experienced engineers and technicians, as well as of young graduates.

Development Services

- Project Consulting
- Feasibility Studies
- Technology Evaluation
- Project and Customer specific Development
 - o Support in the specification Phase
 - o Hardware Development
 - o Software Development
 - o Part or overall project Development
- Application Support
- Assistance in selection of Manufactures
- On the job training

cosyst Control Systems GmbH: With our assistance from the idea to the final product.
